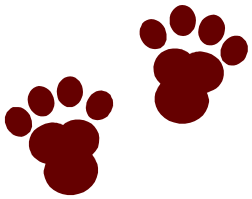
Senior Wellness Checkup

The key to a healthy pet is prevention and early detection of disease.

The older adult life stage is most critical in determining how many years your pet will live. All dogs and cats age 7 and older are considered "Seniors". Ignoring problems here will allow chronic, inapparent organ degeneration, such as dental disease or organ disease, to steal quality years from your pet. Regular dental care, proper nutrition, vaccinations and control of parasites are essential to ensure that your pet is as healthy as possible. In addition, preventive health screening through routine blood testing and electrocardiography (EKG) are important to identify problems early. There are many conditions that can be completely reversed or controlled for extended periods of time if they are diagnosed early. Our Senior Wellness Checkup is designed to give your pet the best "Golden Years".

Our Senior Wellness Checkup Includes:

- ⇒ Comprehensive Physical Exam
- ⇒ Blood Chemistry Profile & Thyroid Screen
- ⇒ Complete Blood Count (CBC)
- ⇒ Urinalysis
- ⇒ Electrocardiogram (EKG)
- ⇒ Nutrional and Behavioral Consultation
- ⇒ Parasite testing
- ⇒ Annual vaccinations



*During your pet's physical exam, one of our veterinarians will explain any abnormal findings and recommendations to you as well as discuss your pet's diet. Blood and urine samples will be collected by one of our trained veterinary technicians, and an electrocardiogram (EKG) will be performed. The results of these tests will be back normally within 24-48 hours, and a veterinarian will call you to let you know if all the test results were normal. If there are any abnormalities, these will be explained to you and medication or further testing may be advised.
